

Arctic Daily Intelligence Brief

Sea Ice Summary (Prithvi-EO)

Sea-ice concentration remains moderate across the Beaufort region. Forecast models indicate a 12–18 km drift of the ice edge to the southeast over the next 24 hours. No major leads or hazardous ridging detected.

Weather Summary (Prithvi-WxC)

A low-pressure system moving eastward will bring increased winds (15–20 kts) and reduced visibility due to blowing snow. Freezing spray risk is elevated north of 72°N.

AIS Traffic Overview

Vessel density remains low with 14 active tracks. Three cargo vessels and one research vessel are transiting westbound. No AIS silence or anomalous maneuvers detected in the last 6 hours.

Port & Logistics Status

Key Arctic ports remain operational. No reported access constraints. Fuel and icebreaker support remain available at Prudhoe Bay and Utqiaġvik.

Risk & Watch Items

- Elevated freezing spray risk zone along the Chukchi corridor.
- Moderate ice drift may affect route planning east of 150°W.
- Weather deterioration expected within 18 hours; monitor closely.

Mission Recommendations

- Advise caution for vessels operating north of 72°N due to freezing spray.
- Monitor ice drift using updated Prithvi-EO forecasts at 12-hour intervals.
- No rerouting required at this time, but maintain situational awareness on westbound cargo traffic.
